VirtualBox is a very useful software for creating, running and sharing different virtual machines. Like for running the real OS, the virtual machine will have its own memory, hard disk, networking, etc. For creating virtual machines, you can create a virtual machine using either the virtual machine manager or any of the hypervisor software. Using the virtual machine manager, you can specify the hardware that you want to emulate. To configure the settings for the virtual machine, you can either use the graphical interface or the command line. Using the graphical interface, you can create a virtual machine using the software while you can create a virtual machine using the command line interface. If you prefer the graphical interface, you can import the settings from the.ovf and.ovf.gz file. This is the actual format in which you can store the settings. You can share the.ovf and.ovf.gz file so that other users can use the same settings. Follow the instructions below in order to create a virtual machine and share it with other users: As you can see in the screenshot below, you can import settings from the.ovf and.ovf.gz file. The command line interface is more preferred to the graphical interface. Using the graphical interface, you can create a virtual machine using the software while you can create a virtual machine using the command line interface.
