- Works with virtually any molecule created with Rasmol - Simple and easy to use interface - Rotate, zoom, and pan your molecular space - A variety of views are available - Includes the option to save under one of the common image file types1. Field of the Invention The present invention relates to a light source of a direct-type backlight device for a display device. More particularly, the present invention relates to a light source of a direct-type backlight device for a liquid crystal display device, which prevents a phenomenon in which an irradiated screen of the liquid crystal display device looks hazy. 2. Description of the Related Art A liquid crystal display (LCD) device uses optical anisotropy and polarization properties of liquid crystal molecules to display images. The liquid crystal molecules have a thin and elongated structure. The polarization of the liquid crystal molecules depends on an alignment direction of the liquid crystal molecules. By an electric field applied across the liquid crystal molecules, the alignment direction of the liquid crystal molecules can be controlled and thus the polarization properties of the liquid crystal molecules can be changed. Accordingly, by controlling a polarization direction of incident light, a light transmission amount through the liquid crystal molecules can be changed to display images. Since the LCD device does not emit light by itself, the LCD device may use an additional light source to provide the liquid crystal molecules with light. The light source may be a self-emitting type or an external type. A backlight unit is a frequently used self-emitting type light source. The backlight unit is disposed under a liquid crystal panel, and provides the liquid crystal panel with light. A cold cathode fluorescent lamp (CCFL) has been commonly used as a backlight light source. However, recently, a light emitting diode (LED) has been developed as a backlight light source. As light efficiency of the LED has been improved, brightness of the backlight unit has been gradually increased. However, an LED generates a very high heat. Accordingly, when the LED is used as a light source, a temperature of the LED rises above a normal temperature. As a result, an optical emission efficiency and a life span of the LED are deteriorated. In addition, an external dimension of the LED is gradually increased. Therefore, when a width dimension of a printed circuit board used for the backlight device is fixed, it is difficult to implement a slim backlight device.
