Arbuscular mycorrhizal (AM) fungi are abundant in the mycorrhizosphere of Cirsium eriophorum in northern Norway, with individual plants containing up to 100 morphologically and physiologically distinct AM fungi. These fungi were identified as members of the families Glomerales and Acaulosporaceae, but the roles of these fungi in C. eriophorum are not known. We examined the AM fungal communities of these species of Cirsium in the mycorrhizosphere of C. eriophorum in northern Norway. The communities were characterized by high variation in AM fungal colonization patterns within individual plants. There was also variation in plant age, root morphology and the nitrogen, phosphorus and potassium content of roots, but we did not detect an effect of these factors on the AM fungal community. The low-frequency of morphologically distinct fungi in the AM fungal community suggests that most of the

AM fungi are represented by a few genotypes. However, the predominant AM fungal morph
