Should We Care about Brain Injury? There's a reason we study the big science, we rarely study the little stuff that keeps the big stuff going, especially if its a little outdated. With that in mind, i thought i should share a web article, written by the family of the CTU's "Brain-Dead" patient Artur Jankowski. Artur Jankowski died last year. A 22-year-old Wisconsin man

who survived multiple car accidents, two brain surgeries, and a fall from a moving vehicle, was declared brain dead by his doctors in October of 2012. In a shocking turn of events, he was kept on life support for 12 days. Jankowski's family filed a wrongful death suit, and, with the help of the Wisconsin Lawyer's Assistance Program, they reached a settlement with the hospital in October of 2013, for \$1.7 million. The

settlement was not a settlement for Artur's brain. On September 13, 2014, the Journal of the American Medical Association published an article about brain death. The article stated that Jankowski's brain "had irreversibly damaged beyond repair" when he was put on life support. Soon after Artur's death, there was a massive outpouring of support from his family and the community. His story and the tragedy of his brain death

affected thousands of people across the U.S., in different ways. Some raised money for a scholarship named after him. Some volunteered their time. None of the people involved in Artur's story were brain-dead, as described in the JAMA article. However, by the time the article came out, they were all dead. Artur's wife and his mother, along with his brother and his sister-in-law were all gone, and the parents of the man who had survived the accident only

weeks before Artur.

Jankowski's brain was so badly damaged that he died within a few weeks of the tragic accident. He was given the diagnosis of brain death two days after the accident, so he was declared brain-dead four days after the accident. In the JAMA article, brain death is described as the failure of the brain to function. The article states that the brain shows no signs of activity and there is no evidence that the brain is

functioning. The heart may still be pumping c6a93da74d
